(a) Question, validation dates, ε = 2 per record

Question

Did respiratory cases in Iztapalapa rise in July 2024 compared with the period before?

Typed plan from the LLM

intent: compare; syndrome: RESP; district: 007; period: July 2024; comparison: previous period

PB-QD

Dates snap to the window grid. Both cells are already in R: 2 reused, 0 fresh.

Answer, written by code

2024-06-29 to 07-31: 278.3 (95% CI 255.4 to 301.1). 2024-05-27 to 06-28: 98.9 (76.1 to 121.7). Change: 179.4 (147.1 to 211.6). Privacy cost: ρ = 0.

(b) Real alert, test period, ε = 2 per record

Gate

Window starting 2025-01-07: score passes the threshold in 1 borough; one event goes to the LLM.

Evidence to the LLM

Released cells, baselines, z-scores, and citywide FLU and COVID values only.

LLM verdict, a priority label

Confirm. The verdict never hides an alert from officials.

Briefing, numbers checked

Suspended [sic] viral respiratory cases rose in IZTACALCO during the window of 2025-01-07 to 2025-01-10, reaching 39.5 released cases. Citywide confirmed influenza also increased to 81.8 released this window, suggesting influenza as a possible contributor. However, reporting changes or privacy noise could account for part of the jump.
